

EXECUTIVE SUMMARY

Sample Superstore - Sales Performance Dashboard

Prepared By: Omolade **Programme:** AnalystLab Africa - Data Analytics Internship, Week 2

Overview

An interactive Power BI dashboard was built to give leadership a real-time view of sales performance across the Sample Superstore retail dataset (9,994 order records). The dashboard consolidates sales, profit, regional, product, and customer segment data into a single, filterable view.

Key Figures

Metric	Value
Total Sales	\$307,800.33
Total Profit	\$24,962.70
Total Orders	1,334
Average Sale	\$230.73
Profit Margin	8.11%

Top Findings

- Furniture generates strong sales but disproportionately weak profit compared to Technology and Office Supplies
- Phones and Chairs are the top-performing sub-categories by sales
- Sales peaked in 2016 and declined into 2017
- The Consumer segment drives nearly half (46.8%) of total sales

- Overall profit margin (8.11%) leaves limited room for rising costs

Priority Recommendations

1. Investigate and fix Furniture's weak profit margin
2. Expand investment in Phones and Chairs
3. Investigate the cause of the post-2016 sales decline
4. Build a loyalty program targeting the Consumer segment
5. Set monthly regional performance targets using the dashboard
6. Adopt the dashboard as a standing tool in leadership meetings

Conclusion

The business is fundamentally healthy but has clear, addressable weak points. Acting on the Furniture profit gap and the recent sales decline should be the immediate priority, while the dashboard itself should become a recurring tool for ongoing decision-making.
